

CASEBRIDGE

Guided Case Journey & Human-Review Preparation Platform

“AI doesn’t decide what happened.
It helps people explain what happened.”

Project Type: Independent Hackathon Prototype

Primary Domain: AI-assisted civic / legal-information organization

Core Concept: A step-by-step case organization journey with contextual assistance, document guidance, clarification, and human-review handoff.

Important: CaseBridge is not an AI lawyer, does not determine legal rights or outcomes, and is not affiliated with or endorsed by the Government of India.

1. Project Overview

CaseBridge is an AI-assisted platform designed to help people organize and explain complicated real-world situations in a structured way. Instead of asking a user to understand legal terminology or immediately produce a formal document, CaseBridge guides the user through a continuous journey: explain what happened, identify important information, understand what may still be missing, collect documents that may help, clarify differences, preserve relevant information, prepare for human review, and track follow-up items.

The central product idea is therefore not document generation. It is **guided case organization**. A document or intake brief is an output of the journey rather than the destination.

CaseBridge is designed around a human-in-the-loop principle. AI can organize and explain information, but the user remains in control of what is recorded, and a qualified human remains responsible for legal evaluation.

2. Problem Statement

People often know what happened to them, but they may not know how to organize the information needed to explain the situation clearly.

Real-world disputes and difficult situations can involve scattered messages, receipts, agreements, bank records, photographs, dates, names, amounts, and incomplete memories. A person may not know which information is important, what documents they already have, what information is still missing, or what should be prepared before speaking with a qualified professional.

Traditional digital forms can make this worse by asking users to provide information in a rigid order. A document generator can produce a polished output without solving the underlying problem of helping the user understand the journey.

CaseBridge addresses this organizational gap by turning an unstructured personal account into an interactive, reviewable workflow while keeping human review central.

Problem statement in one sentence: **How can technology help a person move from a confusing personal story and scattered records to an organized, reviewable case journey without pretending to replace a qualified human professional?**

3. Abstract

CaseBridge is an AI-assisted guided case organization platform that helps users transform complex personal situations into structured, reviewable information for human assistance. The system begins with a natural-language story provided by the user through typing or voice. It extracts structured elements such as people, dates, amounts, events, and relevant statements while retaining source context. Based on the emerging case context, CaseBridge presents a dynamic information checklist and document guidance, allowing users to add available records such as agreements, receipts, transaction records, messages, or photographs.

The platform then compares information from different user-provided sources and identifies items that may need clarification. Rather than determining which source is correct, CaseBridge asks the user to review and clarify the difference. A contextual “Ask CaseBridge” assistant remains available throughout the workflow to explain the current step, answer questions about the recorded information, explain why information may be useful, and identify the next CaseBridge workflow action.

The journey concludes with preparation for human review, including a structured intake package containing the user's account, organized information, documents, source mapping, clarifications, unanswered questions, and follow-up items. CaseBridge may also produce formal document drafts or explain uploaded court notices, but these

functions remain subordinate to the guided journey and are explicitly not legal advice or a substitute for professional review.

4. Objectives

- Make it easy for a person to explain a complicated situation in natural language.
- Convert unstructured information into a structured workspace while preserving source context.
- Ask contextual questions instead of forcing users through a generic form.
- Explain what additional information may help organize the situation.
- Suggest documents that may provide context without claiming that they are legally required.
- Identify information that may need clarification across user statements and uploaded materials.
- Give the user control over corrections, confirmations, explanations, and final inclusion.
- Provide a persistent contextual assistant for questions during the journey.
- Show a clear “Your Next Step” at every stage.
- Prepare an organized package for human or legal-aid review.
- Track follow-up items and workflow status without claiming that a legal matter has been legally resolved.

5. Core Case Journey

The application is structured as a progressive journey rather than a single upload-and-generate action.

01	Tell Your Story	The user explains what happened in their own words.
02	Understand	CaseBridge organizes people, dates, amounts, events and other information.
03	Complete Information	The system asks targeted questions about information that may still be useful.
04	Documents	The system suggests documents that may help provide context.
05	Review & Clarify	The user reviews extracted information and clarifies differences.
06	Precautions	The system presents neutral information-preservation and preparation guidance.
07	Human Review	CaseBridge prepares an organized package for a qualified human reviewer.
08	Follow-up	Outstanding information and follow-up items can be tracked.
09	Complete	The user may mark the CaseBridge workflow complete or reopen it.

6. Functional Architecture

User Layer: Story input, document upload, question answering, corrections, confirmations, and workflow actions.

Case State Layer: One authoritative active case containing story, structured fields, documents, clarifications, next actions, chat messages, follow-ups, review status, and optional notice data.

AI Organization Layer: Extraction and classification services organize information. In the current prototype these services are mocked and are explicitly marked for future real integrations.

Document Guidance Layer: Scenario-aware rules suggest documents that may help. Existing prototype scenarios include rental/deposit, employment, purchase, property damage, online payment, and generic situations.

Clarification Layer: Compares user-provided and document-extracted information and presents neutral clarification choices.

Contextual Assistant: Uses the current case state and current screen to answer workflow questions and explain next steps.

Human Review Layer: Produces an organized intake package rather than making a legal determination.

7. Role of AI

AI is used as an organizational and explanatory layer. The intended workflow is:

- Extract structured information from a natural-language story.
- Retain original wording/source context where possible.
- Identify potentially relevant information categories.
- Generate contextual questions for missing or unclear information.
- Suggest document categories that may provide useful context.
- Extract information from uploaded documents.
- Highlight differences or low-confidence information for user review.
- Explain the current CaseBridge step in simple language.
- Summarize information for human review.

The AI does not determine whether the user's account is true, determine document authenticity, predict an outcome, calculate legal risk, recommend a court, or replace a qualified professional.

8. Contextual “Ask CaseBridge” Assistant

A persistent chat assistant is an important part of the new product design. It is intentionally contextual rather than a generic chatbot.

- What is this step?
- Why are you asking this?
- What documents may help?
- What information is still missing?
- Why does this information need clarification?
- What should I do next?
- Can I continue without this document?
- Explain this in simpler language.

The assistant should know the current stage, current story, structured fields, uploaded documents, clarification status, outstanding questions, and current next action. This prevents the user from having to repeatedly explain the same context.

9. Document Intelligence & Guidance

The current prototype already includes scenario-aware Smart Document Guidance. It separates suggestions into Recommended, Useful if available, and Optional. Examples include rental agreements, payment receipts, bank transaction records, messages, employment letters, salary records, invoices, order confirmations, photographs, repair estimates, and other contextual records.

The design principle is deliberately non-prescriptive: the system explains why a document may help rather than claiming that the document is legally required. Users can upload what they have, indicate that they do not have an item, or skip it.

10. Clarification & Source Mapping

CaseBridge retains the relationship between a structured field and its source. A value may originate from the user's statement, an uploaded document, or a manual entry. The user can review, edit, confirm, or remove structured information.

When different values appear, the system uses neutral language such as "Something may need clarification." For example, if a story mentions ■30,000 and a document mentions ■25,000, the system should not decide which amount is correct. It asks the user how the two values relate and records the user's explanation.

11. Human-in-the-Loop Review

The human reviewer is central to the design. CaseBridge prepares an organizational package containing the user's original account, structured information, timeline, people mentioned, amounts, documents, source history, clarifications, unanswered questions, and follow-up items.

This separation is important: AI performs organization and explanation; the user controls the recorded representation; the qualified human evaluates the matter.

12. Court Notice Explainer

The current website also contains a separate Court Notice Explainer. It can identify information such as document type, court information, case number/CNR, named parties, dates, appearance information, instructions, mentioned documents, and unfamiliar terms in a synthetic demonstration flow.

It also allows users to ask questions about the notice. The intended purpose is to explain what the document says in simpler language, not to provide legal advice or determine what the user should do.

13. Outputs

- Structured Case Workspace
- Information Checklist
- Document Guidance
- Clarification Record
- Human Review Package / Intake Brief
- Follow-up Checklist
- Optional formal document draft where appropriate
- Court Notice explanation package

The formal brief is an output of the journey, not the primary product.

14. Current Prototype Technology

- Single-file HTML prototype.
- HTML, CSS and vanilla JavaScript.
- Tailwind CSS via CDN in the current file.
- Browser-based state and interaction model.
- Mock AI extraction services designed with future API integration points.
- Mock document analysis/OCR behavior for demonstration.
- Responsive desktop/mobile interface.
- Browser print / Save as PDF for the intake brief.
- Synthetic demo data for testing.

The existing code contains comments identifying where real OCR/LLM integrations can later replace mock services. A production implementation would require a secure backend, authentication, appropriate storage, consent, access control, retention/deletion controls, and carefully evaluated AI services.

15. What Makes the Concept Distinct

The differentiating concept is the combination of **guided workflow + structured case state + source mapping + dynamic information/document guidance + clarification + contextual assistant + human-review handoff**.

A simple chatbot answers questions. A document generator produces a document. A form collects fields. CaseBridge is designed to connect these functions into a continuous journey in which the system repeatedly answers: “What do we know, what is still unclear, and what is the next CaseBridge step?”

16. Example Use Case — Rental Deposit Dispute

User story: “I rented a house, paid ■30,000 as a deposit, moved out, and received ■25,000 back. The landlord mentioned repairs.”

CaseBridge response: It organizes the people, amounts, dates and events; asks relevant questions; suggests a rental agreement, payment record, refund record and relevant messages as potentially useful documents; analyzes uploaded synthetic documents; notices the ■30,000 / ■25,000 difference; asks the user to clarify the relationship; records the user's explanation; presents information-preservation guidance; and prepares the organized information for human review.

The system does not independently decide that ■5,000 was correctly deducted or that either party is legally right.

17. Safety, Scope & Trust Boundaries

- No legal advice.
- No prediction of case outcomes.
- No recommendation of courts or legal forums.
- No determination of legal rights.
- No authenticity verification.
- No truth determination.

- No case-strength or legal-risk score.
- No automatic legal deadlines.
- No claim of government affiliation.
- No claim of guaranteed court acceptance.
- Human/legal review remains necessary where appropriate.

Preferred language includes “user-provided,” “AI-extracted,” “confirmed by you,” “needs clarification,” “may help,” and “for human review.”

18. Privacy & Data Handling

For the hackathon prototype, synthetic fictional information should be used for demonstrations. The prototype should not claim production-grade security or compliance. A production system would require consent management, secure transport, secure storage, authentication, role-based access controls, auditability, retention limits, deletion controls, and appropriate handling of sensitive documents.

19. Hackathon Demonstration Flow

A strong demonstration should show the complete journey rather than jumping directly to the final PDF:

- Start a new intake.
- Tell a short story naturally.
- Show CaseBridge organizing the story.
- Answer a few contextual questions.
- Open the document guidance.
- Upload synthetic documents.
- Show source mapping and extracted fields.
- Trigger a clarification using different amounts.
- Use “Ask CaseBridge” to ask why clarification is needed.
- Show precautions and “Your Next Step.”
- Prepare the human-review package.
- Add and complete a follow-up item.
- Show the completion state.
- Optionally demonstrate the Court Notice Explainer.

20. Future Development

- Real speech-to-text with multilingual support.
- Production OCR and document layout extraction.
- Structured LLM extraction with strict schemas and source spans.
- Secure backend and authenticated user accounts.
- Persistent case storage with access controls.

- Human reviewer portal.
- Organization/legal-aid worker workflow.
- Consent and privacy controls.
- Audit trail.
- Multilingual conversational guidance.
- Accessibility improvements for low-literacy and voice-first users.
- Carefully evaluated integrations with legitimate public information services where technically and legally appropriate.

21. One-Minute Project Explanation

“CaseBridge is an AI-assisted guided case organization platform. A person starts by simply explaining what happened in their own words. Instead of immediately generating a letter, CaseBridge understands the story, asks for missing information, suggests documents that may help, organizes uploaded records, identifies information that may need clarification, and lets the user correct or confirm what was extracted. A contextual Ask CaseBridge assistant is available throughout the process, and the system always shows the user's next workflow step. Finally, CaseBridge prepares a structured package for human review and can track follow-up items. AI does not decide who is right or provide legal advice; it helps people explain what happened and prepare information for a qualified human.”

22. Final Project Identity

CASEBRIDGE

Guided Case Journey for Human-Review Preparation

“AI doesn’t decide what happened.
It helps people explain what happened.”

Core value: Turn confusion into an organized journey without pretending that AI can replace human judgment.

Hackathon positioning: An independent prototype focused on accessibility, structured information, source transparency, contextual assistance, and human-in-the-loop workflows.

This document describes the intended CaseBridge product concept and the current prototype direction. It is not legal advice and does not establish legal requirements for any particular jurisdiction or filing.
